

Cloud-first approach adopted by one of the UK's most prevalent property companies

A FTSE 100 property investment company wanted to make use of cloud solutions to improve access to applications, documents and email from any device in any location without installing software. They wanted to enable users to work smarter, more flexibly and more mobile while improving collaboration between teams across the group and with external parties. They also wanted to increase business productivity and enable consolidation of common functions across the group onto a single unified platform.

We were engaged to conduct a programme level assessment, looking at the objectives, team structure, project approach, plans and budget. We recommended restructuring the programme into logically grouped components centred around skillset of the technical teams. Objectives were prioritized focusing on a few quick wins to bolster maximum confidence and support from senior leadership. Specialist third-party vendors and tools were sourced to ensure continuity of service and integrity of data. Change, communications and training resources were recommended to drive adoption.

We helped the client to successfully navigate the tricky journey from Google G-Suite to Office 365, implemented Box for secure sharing of unstructured data, OneDrive and Teams for better cloud collaboration, completed a migration to SharePoint Online and migrated all custom applications to a new hosting platform.

Our involvement in the consulting and management of the programme facilitated the integration of group companies onto a single unified platform. It increased and streamlined the collaboration and processes between group companies and allowed for seamless transition of strategy divestment of key business units.
